March 24, 2017

2 Theory questions

- 1. The pooling layer serves to progressively reduce the spatial size of the representation, to reduce the number of parameters and amount of computation in the network, and hence to also control overfitting(CS231n lecture). In practice, its use is to downsample its input, reducing the amount of resources that the network needs in order to perform the computations by reducing the dimensions of the input using a filter, a stride and an elementwise activation function. Also, after the downsampling it is obvious that the network will have less parameters. As a result, it will be able to generalize better in new situations and avoid overfitting(small training set error, large error for new examples).
- 2. Weight sharing is a very important feature, as it can dramatically reduce the number of weights (less computations). The idea behind this is that the number of unique sets of weights can be equal to the depth dimension size. This can applied because of the fact that, assuming that a single depth slice weight configuration is associated with a single feature that our network is looking for (edges, circles etc.), in every single one spatial region that the filter checks, it responsible of tracing these specific features. ???(filters depth not sure equal)

3.

- 4. (a) From the given data and the formula to compute the output we have that W=12, F=3, P=0 and S=1, so output = W F + 2 * P / S + 1 = 12 3 + 2 * 0 / 1 + 1 = 10 and because we have 3 filters the total neurons will be 10 x 10 x 3 = 300.
 - (b) The input layer is our image and if we assume that each pixel is one neuron our input layer consists of $12 \times 12 = 144$ neurons and each of them will be fully connected to our neurons in the hidden layer which consists of 300 neuros. As a result the total connections between input and hidden layer will be $144 \times 300 = 43200$. Complete subquestion about parameters
- 5. This approach to solve the car decision problem is questionable because even though we can use CNN's and get a network that can decide between cars an average solution, the features that characterise the car can be subjective for different customers depending on their needs and comforts.

4 Convolutional Layer

- function convolvedFeatures = cnnConvolve(filterDim, numFilters, images, W, b)
- $_{
 m 2}$ %cnnConvolve Returns the convolution of the features given by W and b with
- 3 %the given images

```
4 %
5 % Parameters:
6 % filterDim - filter (feature) dimension
     numFilters - number of feature maps
     images - large images to convolve with, matrix in the form
              images(r, c, image number)
10 % W, b - W, b for features from the sparse autoencoder
          W is of shape (filterDim, filterDim, numFilters)
12 %
            b is of shape (numFilters,1)
13 %
14 % Returns:
_{15} % convolvedFeatures - matrix of convolved features in the form
                         convolvedFeatures(imageRow, imageCol, featureNum, imageNum)
numImages = size(images, 3);
imageDim = size(images, 1);
20 convDim = imageDim - filterDim + 1;
21 convolvedFeatures = zeros(convDim, convDim, numFilters, numImages);
23 % Instructions:
24 %
     Convolve every filter with every image here to produce the
     (imageDim - filterDim + 1) x (imageDim - filterDim + 1) x numFeatures x numImages
26 % matrix convolvedFeatures, such that
27 % convolvedFeatures(imageRow, imageCol, featureNum, imageNum) is the
28 % value of the convolved featureNum feature for the imageNum image over
     the region (imageRow, imageCol) to (imageRow + filterDim - 1, imageCol + filterDim -
29 %
       1)
30 %
31 % Expected running times:
     Convolving with 100 images should take less than 30 seconds
    Convolving with 5000 images should take around 2 minutes
      (So to save time when testing, you should convolve with less images, as
35 %
      described earlier)
36
37 %%% Add code here
      for i=1:numImages
38
          im = images(:,:,i);
39
          for j=1:numFilters
              cw = rot90(W(:,:,j),2);
              cf = conv2(im,cw,'valid') + b(j);
42
              convolvedFeatures(:,:,j,i) = 1./(1+exp(-cf));
43
          end
45
      end
46 end
```

5 Mean Pooling Layer

```
function pooledFeatures = cnnPool(poolDim, convolvedFeatures)
%cnnPool Pools the given convolved features
%
%
Parameters:
% poolDim - dimension of pooling region
```

```
6 % convolvedFeatures - convolved features to pool (as given by cnnConvolve)
7 %
                          convolvedFeatures(imageRow, imageCol, featureNum, imageNum)
8 %
9 % Returns:
     pooledFeatures - matrix of pooled features in the form
                       pooledFeatures(poolRow, poolCol, featureNum, imageNum)
12 %
numImages = size(convolvedFeatures, 4);
numFilters = size(convolvedFeatures, 3);
convolvedDim = size(convolvedFeatures, 1);
  pooledFeatures = zeros(convolvedDim / poolDim, ...
          convolvedDim / poolDim, numFilters, numImages);
18
19 % Instructions:
    Now pool the convolved features in regions of poolDim x poolDim,
      to obtain the
22 %
      (convolvedDim/poolDim) x (convolvedDim/poolDim) x numFeatures x numImages
      matrix pooledFeatures, such that
      pooledFeatures(poolRow, poolCol, featureNum, imageNum) is the
      value of the featureNum feature for the imageNum image pooled over the
26 %
      corresponding (poolRow, poolCol) pooling region.
27 %
28 %
      Use mean pooling here.
29
  %%% Add code here
30
      for i=1:numImages
          for j=1:numFilters
              x=1;
              y=1;
34
              for k=1:poolDim:convolvedDim
35
                   for l=1:poolDim:convolvedDim
                       pooledFeatures(x,y,j,i) = mean2(convolvedFeatures...
37
                           (k:k+poolDim-1,l:l+poolDim-1,j,i));
38
                       if(y==(convolvedDim / poolDim))
                           x=x+1;
                           y=1;
41
                       else
42
                           y = y+1;
43
                       end
                   end
45
              end
46
          end
48
49 end
```

7 Experiments

1. Question 1

2. In the beginning of the training we see that our filters look like random noise patches but as our training progresses we see that the filters achieve more structure and finally after 3 epochs we can see clearly on them shapes e.g.(lines, angles, curves) that they can recognize on images that we feed to our network.

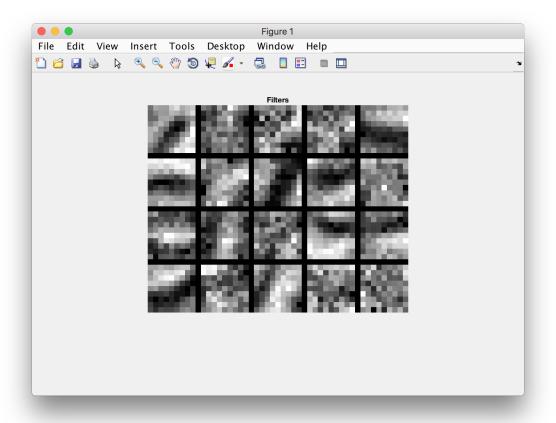

Figure 1: Filters after 3 epochs

3. Our network accuracy after 3 epochs is 97.24%
